**Τίτλος:** Non-local games: operator algebraic approaches

**Abstract:** In the past several years non-local games have become increasingly prominent in operator algebra theory. Accordingly, a toolkit has been shaping up for their study from the point of view of Functional Analysis, that borrows significantly from the theory of operator systems.

In this talk, I hope to highlight the main brushstrokes of this development, after giving a brief introduction to the notion of a non-local game and some relevant examples.
