$\mathcal{B}(H)$

Let H be a Hilbert space. The algebra of all bounded linear operators $T : H \rightarrow H$ is denoted $\mathcal{B}(H)$. It is complete under the norm

$$\|T\| = \sup\{\|Tx\| : x \in \text{ball}(H)\}$$

Moreover, it has an *involution* $T \rightarrow T^*$ defined via

$$\langle T^*x, y \rangle = \langle x, Ty \rangle \quad \text{for all } x, y \in H.$$

This satisfies

$$\|T^*T\| = \|T\|^2 \quad \text{the } C^* \text{ property.}$$

$\mathcal{B}(H)$ is a C*-algebra

Structure of $\mathcal{B}(H)$:

- 1 linear space
- 2 ring for composition of operators [thus, an associative algebra]
- 3 *-vector space with identity
- 4 has a complete submultiplicative norm ($\|TS\| \leq \|T\| \|S\|$)
- 5 norm satisfies the C^* property $\|T^* T\| = \|T\|^2$

Provisional Definitions

- **Operator space**: A linear subspace of $\mathcal{B}(H)$ (sometimes assumed closed)
- **Operator system**: A selfadjoint (i.e. *-closed) linear subspace of $\mathcal{B}(H)$ containing the identity
- **C*-algebra**: A selfadjoint, $\|\cdot\|$ -closed subalgebra of $\mathcal{B}(H)$

Function Spaces

A **concrete function space** is a linear subspace $E \subseteq \ell_\infty(\Gamma)$ for some Γ .

Is E/N a concrete function space on some Γ' ?

Remark

Every normed space can be isometrically represented as a concrete function space.

Given $(E, \|\cdot\|)$ and $n \in \mathbb{N}$, consider

$\ell_\infty^n(E) := \{([x_1, \dots, x_n] : x_i \in E\}$ with sup norm.

Note that if $E \subseteq \ell_\infty(\Gamma)$ then $\ell_\infty^n(E) \subseteq \ell_\infty(\Gamma \times [n])$ isometrically.

Remark

If E is function system, so is $\ell_\infty^n(E)$ for all $n \in \mathbb{N}$.

Operator Spaces

“Quantize”: Replace function in $\ell_\infty(\Gamma)$ by operators in $\mathcal{B}(H)$ for some Hilbert space H .

Given a subspace $E \subseteq \mathcal{B}(H)$ and $n \in \mathbb{N}$, then

$M_n(E) \subseteq M_n(\mathcal{B}(H))$ as linear spaces.

But note $M_n(\mathcal{B}(H)) \simeq \mathcal{B}(H^n)$ as linear spaces, where

$H^n := \{\vec{h} := [h_1, \dots, h_n] : x_i \in H\}$ with $\langle \vec{h}, \vec{h}' \rangle := \sum_{k=1}^n \langle h_k, h'_k \rangle_H$

and $M_n(\mathcal{B}(H)) \rightarrowtail \mathcal{B}(H^n) : [a_{ij}] \mapsto A\vec{h} = [\sum_{j=1}^n a_{ij} h_j]$.

Remark

If E is an operator space on H , then, for all $n \in \mathbb{N}$, $M_n(E)$ is an operator space on H^n .

So the embedding $j : E \rightarrowtail \mathcal{B}(H)$ defines a sequence of norms $\{\|\cdot\|_{M_n(E)} : n \in \mathbb{N}\}$.

Operator Spaces

Definition

An **operator space** E is a pair (E, j) where E is a linear space and $j : E \rightarrow \mathcal{B}(H)$ a linear embedding. If

$$\|[x_{ij}]\|_{M_n(E)} \stackrel{\text{def}}{=} \|j(x_{ij})\|_{\mathcal{B}(H^n)} \quad (x_{ij} \in E),$$

¹ the sequence of norms $\{\|\cdot\|_{M_n(E)} : n \in \mathbb{N}\}$ is called the **operator space structure** on E induced by j .

Definition

An **operator space structure on a normed space** $(E, \|\cdot\|)$ is the operator space structure induced by a linear **isometric** embedding $j : E \rightarrow \mathcal{B}(H)$ for some Hilbert space H .

(Thus $\|j(x)\|_{\mathcal{B}(H)} = \|x\|_E$ for all $x \in E$)

¹Thanks, Dimos!

Completely bounded maps

Notation Given a linear map $\phi : \mathcal{B}(H) \rightarrow \mathcal{B}(H')$, for any $n \in \mathbb{N}$ define $\phi_n : \mathcal{B}(H^n) \rightarrow \mathcal{B}(H'^n) : [a_{il}] \mapsto [\phi(a_{ij})]$.

Definition

A linear map $\phi : E \rightarrow F$ between operator spaces is said to be **completely bounded** if (each $\phi_n : M_n(E) \rightarrow M_n(F)$ is bounded and) $\|\phi\|_{cb} := \sup_n \|\phi_n\| < \infty$.

The map ϕ is said to be **completely isometric** if each $\phi_n : M_n(E) \rightarrow M_n(F)$ is an isometry.

Thus if $j : E \rightarrow \mathcal{B}(H)$ is an isometric embedding, the induced operator space structure on E is by definition the one making $j_n : (M_n(E), \|\cdot\|_{M_n(E)}) \rightarrow (\mathcal{B}(H^n), \|\cdot\|_{\mathcal{B}(H^n)})$ isometric for all n , i.e. making j a complete isometry.

The minimal operator space structure on $(E, \|\cdot\|_E)$

Remark

Every normed space $(E, \|\cdot\|_E)$ admits an operator space structure.

Proof Embed $E \hookrightarrow \ell_\infty(\Gamma)$ isometrically, then embed $\ell_\infty(\Gamma) \hookrightarrow \mathcal{B}(\ell_2(\Gamma)) = \mathcal{B}(H)$ as diagonal operators. Let j be the composite, so $\|j(x)\|_{\mathcal{B}(H)} = \|x\|_E$ for all $x \in E$. For $n \in \mathbb{N}$ and $x = [x_{ij}] \in M_n(E)$, define $\|x\|_{M_n(E)} := \|j_n(x)\|_{\mathcal{B}(H^n)}$. □

This op. space structure is called **the minimal op. structure** $\min E$ on $(E, \|\cdot\|_E)$. It has the universal property:

If F is an op. space and $\phi : F \rightarrow E$ a bounded linear map, then $\|\phi\|_{cb} = \|\phi\|$.

For $n \in \mathbb{N}$ and $x = [x_{ij}] \in M_n(E)$,

$$\|[x_{ij}]\|_{\min} = \sup\{\|\phi([x_{ij}])\|_{\mathcal{B}(H^n)} : \phi : E \rightarrow \mathbb{C} \text{ contraction}\}$$

(using $\text{ball}(E^*)$ for Γ).

The maximal operator space structure on $(E, \|\cdot\|_E)$

Let \mathcal{S} be the family of all isometric embeddings $\phi : E \rightarrow \mathcal{B}(H_\phi)$ (this is not empty since $\min E$ exists).

The max structure corresponds to the embedding given by the ‘direct sum’ (suitably defined) of all the embeddings $\phi : E \rightarrow \mathcal{B}(H_\phi)$.

Each ϕ induces a norm $\|\cdot\|_n^\phi$ on each $M_n(E)$ given by

$\|[x_{ij}]\|_n^\phi = \|[\phi(x_{ij})]\|_{\mathcal{B}(H_\phi^n)}$. The max norm is defined to be the supremum of these norms:

$$\|[x_{ij}]\|_{\max} = \sup \{ \|[\phi(x_{ij})] \|_{\mathcal{B}(H_\phi^n)} : (\phi, H_\phi) \in \mathcal{S} \}, \quad [x_{ij}] \in M_n(E)$$

(this supremum is finite, since²

$$\|[\phi(x_{ij})] \|_{\mathcal{B}(H_\phi^n)} \leq \left(\sum_{i,j} \| \phi(x_{ij}) \|_{\mathcal{B}(H_\phi)}^2 \right)^{1/2} = \left(\sum_{i,j} \| x_{ij} \|_E^2 \right)^{1/2}.$$

²Thanks, Mihalis!

The maximal and minimal operator space structures

The maximal operator space structure $\max E$ on $(E, \|\cdot\|_E)$ has the universal property:

If V is an op. space and $\psi : E \rightarrow V$ a bounded linear map, then $\|\psi\|_{cb} = \|\psi\|$.

To compare:

For $n \in \mathbb{N}$ and $x = [x_{ij}] \in M_n(E)$,

$$\|[x_{ij}]\|_{\min} = \sup\{\|[\phi(x_{ij})]\|_{\mathcal{B}(H^n)} : \phi : E \rightarrow \mathbb{C} \text{ contraction}\}$$

$$\|[x_{ij}]\|_{\max} = \sup\{\|[\phi(x_{ij})]\|_{\mathcal{B}(H_\phi^n)} : \phi : E \rightarrow \mathcal{B}(H_\phi) \text{ contraction}\}$$

(by the universal property of \max , using contractions instead of isometries does not increase $\|\cdot\|_{\max}$).

Example: $\min(\ell^1[d])$ and $\max(\ell^1[d])$

Let $d \in \mathbb{N}$ and $H = L^2(\mathbb{T}^d)$. For $k \in [d]$ let $V_k \in \mathcal{B}(H)$ be multiplication by the k -th coordinate function:

$(V_k f)(z_1, \dots, z_d) = z_k f(z_1, \dots, z_d)$ ($f \in H$). Then $V_1, \dots, V_d \in \mathcal{B}(H)$ are **commuting** unitaries. Write $\mathcal{C}_d = \text{span}\{V_1, \dots, V_d\} \subseteq \mathcal{B}(H)$.

The map

$$J : \ell^1[d] \rightarrow \mathcal{C}_d \subseteq \mathcal{B}(H) : [a_k] \mapsto \sum_{k=1}^d a_k V_k$$

is a linear isometry, and $J(\ell^1[d]) \simeq \min(\ell^1[d])$ completely isometrically.

$\min(\ell^1[d])$ and $\max(\ell^1[d])$ continued

Let \mathbb{F}_d be the free group in d generators u_1, \dots, u_d and let (π, H_π) be the **universal** unitary representation of \mathbb{F}_d (the direct sum of all unitary representations on (separable) Hilbert spaces). Let $U_1, \dots, U_d \in \mathcal{B}(H_\pi)$ be the images of the generators: $U_k = \pi(u_k)$. These are **free** unitaries. Write $\mathcal{Z}_d = \text{span}\{U_1, \dots, U_d\} \subseteq \mathcal{B}(H_\pi)$.

The map

$$J_\pi : \ell^1[d] \rightarrow \mathcal{Z}_d \subseteq \mathcal{B}(H_\pi) : [a_k] \mapsto \sum_{k=1}^d a_k U_k$$

is a linear isometry, and $J_\pi(\ell^1[d]) \simeq \max(\ell^1[d])$ completely isometrically.
