## Main research interests/achievements

1. Partial breakings in  $N = 2$  matter-coupled supergravities, containing the universal hypermultiplet and Abelian vector multiplets with Minkowski and AdS vacua.
2. Holographic reconstruction of Ricci flat spacetimes from boundary data, i.e. a conformal Carrollian fluid living on the null infinity of the corresponding bulk solution.
3. Integrable relevant deformations of CFTs with current bilinears and interpolations between exact/coset CFTs and their quantum properties in the plane and in the upper-half plane.
4. The M2–M5 intersection in the supergravity regime using the blackfold approach and the finite temperature effects for non-extremal (non-)rotating self-dual string soliton solutions.
